

CASE STUDY

ENERGY SURVEY FOR ORACLE CORPORATION

" We approached BSRIA for their independent status and technical expertise to provide a professional perspective on our energy consumption, establishing where we are and how to begin to make improvements"

CLIFF HILTON

The challenge

Oracle invited BSRIA to conduct an energy survey to provide an independent view on two of its UK buildings' energy consumption. This was for the purpose of comparing the buildings' energy use with a survey previously conducted on its US buildings. The energy survey was to include identification of potential energy wastages and any possible solutions.

The process

In response to this request BSRIA provided the following outputs:

- A site inspection report
- In depth energy data analysis
- Sub metering areas of high energy use
- An EPC and DEC rating and certificates
- Analysis of ratings and further comparison with UK benchmarks
- A final report identifying problems and recommending solutions

The benefits

- Improved understanding of both buildings' energy consumption
- Independent perspective on energy issues surrounding the buildings, showing buildings perform to 'good practice' against Energy Consumption Guide 19: Energy Use in Offices benchmarks
- Evidence based research to present to US head offices
- Knowledge on steps that can be taken to improve energy efficiency on these and other buildings
